Re: Phase II Subsurface Investigation Letter Report
Proposed Industrial Building Complex, North Sanderson Avenue, San Jacinto, Riverside County,
California

Dear Mr. Perales:

Roux Associates, Inc. (Roux) has prepared this Phase II Subsurface Investigation Letter Report (Report) for Shea Properties (CLIENT) to summarize the findings of the subsurface investigations conducted at the approximately 470-acre vacant property located west of North Sanderson Avenue, east of Odel Avenue and south of Ramona Boulevard in the City of San Jacinto, California (Site; Figure 1). The scopes of work, as detailed in Roux's proposals dated August 19, 2021 and October 1, 2021, were developed to address recognized environmental conditions (RECs), identified by Roux in the Phase I Environmental Site Assessment (Phase I ESA), dated October 25, 2021.

The Phase II Investigation focused on addressing the following RECs:

- Potential pesticide impacts to shallow soils from former agricultural (row crop) uses;
- Potential VOC, metals, pesticides, total petroleum hydrocarbon (TPH), and/or methane impacts from former on-Site heifer raising farm uses, including multiple livestock corrals and an unlined pond; and
- Potential petroleum impacts from former on-Site aboveground storage tanks (ASTs);

The sections that follow provide additional details of the investigation activities completed.

METHODS OF INVESTIGATION

Pre-Field Activities

Prior to the start of field activities, Roux prepared a Site-specific Health and Safety Plan (HASP) to ensure worker safety. In addition to containing information regarding Roux's standard safety practices, the HASP contained information about potential hazards related to Site activities and provided the locations and contact information of nearby emergency services. Field workers acknowledged their familiarity with all safety procedures and indicated their intent to follow the HASP by signing the HASP after the tailgate safety meeting, which took place at the beginning of each field day.

At least 48 hours prior to fieldwork, the areas of the Site targeted for the investigation were marked in white paint and Underground Service Alert (USA) was notified of the intended intrusive work. Additionally, to assess the locations of buried utilities (i.e., natural gas, electric, water, sewer, telephone, fiber optic, etc.) or obstructions, a private geophysical services and utility locating firm, Spectrum Geophysics of Chatsworth, California, was contracted to perform a geophysical survey to clear the proposed boring locations of potential subsurface obstructions prior to boring advancement.

Soil Sampling – Agricultural Uses

On September 1 and 2, 2021, a total of 184 soil samples were collected from 46 quadrants (SS-1 through SS-46) across the Site at depths of 0.5 feet below ground surface (bgs) as shown in Figure 2. Soil sampling locations were evenly distributed in a grid pattern across each quadrant.

Four soil samples were collected with a trowel and/or a hand auger from each quadrant, composited in the field, and placed into laboratory-provided glass jars. A total of 184 soil samples were composited into 46 composite samples (SS-COMP-1 through SS-COMP-46).

After sample collection, all soil samples were labeled, placed on ice, and transported under chain-of-custody to Enthalpy Analytical (Enthalpy) of Garden Grove, California, a California-certified laboratory. Soil samples were analyzed in accordance with the sampling and analysis plan as shown in Table 1.

Soil Sampling – USTs, Livestock, and Unlined Pond

On September 7, 2021, under the direction of Roux, Strongarm Environmental Field Services, Inc. (Strongarm) of Fullerton, California advanced 10 soil borings (SV-1 through SV-10, Figure 2). The sampling locations for this investigation targeted the former USTs. Borings SV-1 and SV-2 were advanced to a depth of 5 feet below ground surface (bgs) using a hand auger to clear for utilities and subsequently drilled to the terminal depth of 20 feet bgs using a direct push drilling rig. Borings SV-3 through SV-10 were advanced to a terminal depth of 5.5 feet bgs using a hand auger.

Based on the laboratory results for samples collected on September 7, 2021, additional soil samples were collected on October 8, 2021. Under the direction of Roux, Strongarm advanced seven additional borings at the Site. Two borings, SV-1A and SV-3A, were placed near the original SV-1 and SV-3 locations, respectively. Five additional borings (SV-11 through SV-15, Figure 3) were placed in the proximity of the former residential/agricultural structures on-Site. All borings were pre-cleared to a depth of 5 feet bgs using a hand auger to check for utilities and subsequently drilled to a terminal depth of 25 feet bgs using a direct push drilling rig.

During boring advancement, soil samples were collected from borings SV-1 and SV-2 at depths of 5, 10, 15, and 20 feet bgs; from borings SV-3 and SV-4 at 5 feet bgs; and from borings SV-5 at 0.5 and 5 feet bgs. The soil samples collected at 0.5 feet bgs from borings SV-5 as well as all soil samples collected at 5 feet bgs from borings SV-1 through SV-5 were collected directly from the hand auger bucket. The soil samples collected at depths of 10, 15, and 20 feet bgs from borings SV-1 and SV-2 were collected from acetate sleeves.

After sample collection, all soil samples were labeled, placed on ice, and transported under chain-of-custody to Enthalpy of Garden Grove, California, a California-certified laboratory. Soil samples were analyzed in accordance with the sampling and analysis plan as shown in Table 1.

Soil Vapor Probe Installation

On September 7, 2021, following advancement of borings SV-1 through SV-10, temporary soil vapor probes were installed. Dual-nested soil vapor probes were installed at depths of 5 feet bgs and 15 feet bgs at locations SV-1 and SV-2. Soil vapor probes were installed at 5 feet bgs at SV-3 through SV-10. Soil vapor sampling locations are shown in Figures 3 and 4.

On October 8, 2021, following advancement of borings SV-1A, SV-3A, and SV-11 through SV-15, temporary soil vapor probes were installed. One soil vapor probe was installed at a depth of 25 feet bgs at location SV-1A, one dual-nested soil vapor probe was installed at 15 and 25 feet bgs at location SV-3A, and five triple-nested soil vapor probes at depths of 5, 15, and 25 feet bgs were installed at locations SV-11 through SV-15. Soil vapor sampling locations are shown in Figures 3 and 4.

The soil vapor probes were constructed in general accordance with the California Environmental Protection Agency, Department of Toxic Substances Control (DTSC), Los Angeles Regional Water Quality Control Board (LARWQCB), and San Francisco Regional Water Quality Control Board Advisory, Active Soil Gas Investigations (Soil Gas Advisory), dated July 2015. After the installation of each soil vapor probe, a minimum 48-hour equilibrium period was observed prior to sampling the five-foot probes and a minimum two-hour equilibrium period was observed prior to sampling 15-foot and 25-foot probes, per the Soil Gas Advisory.

Soil Vapor Sampling

On September 10, 2021, Roux collected samples from the temporary soil vapor probes installed at SV-1 through SV-10. On October 11, 2021, under the direction of Roux, Optimal Technology (Optimal) of Thousand Oaks, CA, collected samples from the temporary soil vapor probes installed at SV-1A, SV-3A, and SV-11 through SV-15. Prior to purging and sampling, a shut-in test was performed at each probe to confirm that the above-ground lines and valves were properly sealed. Upon successful completion of the shut-in test, three purge volumes of stagnant air were subsequently extracted from the soil vapor probe system at a flow rate of 200 milliliters per minute (mL/min). During purging and sampling, a leak check compound, 1,1-difluoroethane (1,1-DFA) or Isobutane, was applied adjacent to the sample train connections as a tracer gas to detect potential leaks in the sampling system.

After purging soil vapor probes SV-1 through SV-10, Roux collected soil vapor samples using 1-liter summa canisters equipped with 200 mL/min flow controllers. Following sample collection, soil vapor samples were transported under proper chain of custody to Enthalpy.

After purging soil vapor probes SV-1A, SV-3A, and SV-11 through SV-15, Optimal collected soil vapor samples in laboratory-prepared glass syringes; and immediately analyzed them on-Site using a mobile laboratory.

Soil vapor samples collected from SV-1 through SV-4, SV-1A, SV-3A, and SV-11 through SV-15 were analyzed for VOCs by USEPA Method TO-15 or USEPA Method 8260B. Soil vapor samples collected from SV-5 through SV-10 were analyzed for VOCs by USEPA Method TO-15 and methane by ASTM Method D-1946.

RESULTS

Analytical results for soil samples are summarized in Tables 2 through 5, and soil vapor results are presented in Tables 6 and 7. The complete analytical laboratory reports are included in Attachment A.

Soil Results

The sections that follow provide a summary of the soil analytical results. Soil sampling locations are shown in Figures 2 and 3.

OCPs

A summary of analytical results for OCPs in soil is presented in Table 2.

In general, individual OCP constituents were reported above laboratory method reporting limits (MRLs) in several borings including:

- dichlorodiphenyldichloroethane (4,4'-DDD);
- dichlorodiphenyldichloroethylene (4,4'-DDE);
- dichlorodiphenyltrichloroethane (4,4'-DDT); and

- eldrin aldehyde.

Detected concentrations were compared to the applicable May 2021 USEPA Regional Screening Level (RSL) for industrial soil and the June 2020 DTSC Human and Ecological Risk Office (HERO) Human Health Risk Assessment (HHRA) Note 3 Screening Level for industrial/commercial soil.

Conclusion: No OCPs were detected above the commercial/industrial screening levels established by USEPA RSLs or DTSC HERO HHRA Note 3 SLs.

Metals

A summary of analytical results for metals in soil is presented in Table 3. A total of 11 metals were detected above laboratory detection limits in at least one of the soil samples analyzed. Detected concentrations were compared to the applicable May 2021 USEPA RSL for industrial soil and the June 2020 DTSC HERO HHRA Note 3 Screening Level for industrial/commercial soil.

Arsenic was detected at concentrations exceeding the regulatory screening levels, ranging from 1.0 to 9.3 milligrams per kilogram (mg/kg), which exceeds the DTSC Note 3 SL (0.36 mg/kg). However, arsenic concentrations were below the upper range of the *Southern California Regional Background Arsenic Concentration in Soil* (Determination of a Southern California Regional Background Arsenic Concentration in Soil, G., Bosan, W., and Outiz, D., DTSC) of 12 mg/kg.

Conclusion: No metals were above background concentrations or the commercial/industrial screening levels established by USEPA RSLs or DTSC HERO HHRA Note 3 SLs.

TPH

A summary of the analytical results for TPH in soil is presented in Table 4.

Conclusion: TPH was not detected above laboratory reporting limits in carbon ranges C6-C44 in any of the samples analyzed.

VOCs

A summary of the analytical results for VOCs in soil is presented in Table 5. Two VOCs, methylene chloride and tert-butyl alcohol (TBA), were detected above laboratory reporting limits in at least one soil sample.

Conclusion: VOCs were not detected above either the applicable USEPA RSL for industrial soil or the DTSC SL for commercial/industrial soil.

Soil Vapor Results

The sections that follow provide a summary of the soil vapor analytical results. A summary of the soil vapor analytical results is presented in Tables 6 and 7. Soil sampling locations are shown in Figures 2 and 3.

VOCs

A summary of the analytical results for VOCs in soil vapor is presented in Table 6.

A total of 17 VOCs were detected above laboratory reporting limits in at least one soil vapor sample. Detected concentrations were compared to the applicable USEPA RSL for commercial/industrial soil vapor and the DTSC SL for commercial/industrial soil vapor when an attenuation factor of 0.03 was applied.

- Trichloroethene (TCE) was detected in soil vapor at concentrations exceeding screening levels. TCE was detected above the applicable USEPA RSL (100 micrograms per cubic meter [$\mu\text{g}/\text{m}^3$]) in two samples (SV-1-15 and SV-3-5) at concentrations of $110 \mu\text{g}/\text{m}^3$ and $210 \mu\text{g}/\text{m}^3$, respectively.
 - Borings SV-1 and SV-3 were located in the area of former residential and agricultural structures including a maintenance building.
 - All detections of TCE were below the applicable DTSC SL ($267 \mu\text{g}/\text{m}^3$).
 - Additional soil vapor sampling, focused in the area of the former residential/agricultural structures, did not yield detectable concentrations of TCE above laboratory reporting limits.

Conclusion: TCE was detected at concentrations that exceeded applicable conservative USEPA RSL at two locations. However, no sources were identified on-Site and the generally low TCE concentrations do not suggest that any mitigation or remediation will be required. All other VOCs were below the DTSC's Commercial/Industrial Soil Vapor SL or USEPA's Industrial Soil Vapor RSL.

Methane

A summary of the analytical results for methane in soil vapor is presented in Table 7.

Methane was detected above laboratory method reporting limits in six soil vapor samples (SV-5-5 through SV-10-5) at concentrations ranging from 2.3 parts per million by volume (ppmv) to 3.7 ppmv. Detections of methane did not exceed the cautionary value of 1,000 ppmv or response value of 5,000 ppmv established by the DTSC Advisory on Methane Assessment and Common Remedies at School Sites.

Conclusion: Methane concentrations detected at the Site do not present a potential concern for the Site.

RECOMMENDATIONS

Based on the results of this Phase II Subsurface Investigation, Roux has addressed the RECs identified in the Phase I ESA and does not have any additional recommendations at this time.

This data package contains sample and QC results for fifty one soil samples, requested for the above referenced project on 09/02/21. The samples were received cold and intact.

Pesticides (EPA 8081A):

Low recoveries were observed for endrin aldehyde and endrin ketone in the MS/MSD for batch 273570; the parent sample was not a project sample, and the LCS was within limits. High recoveries were observed for a number of analytes; the LCS was within limits. High RPD was observed for aldrin, endosulfan sulfate, and endrin; these analytes were not detected at or above the RL in the associated sample. High RPD was observed for methoxychlor in the MS/MSD of SS-COMP-1 (lab # 450050-001); this analyte was not detected at or above the RL in the associated samples. High RPD was observed for endrin ketone in the MS/MSD for batch 273369; the parent sample was not a project sample, and this analyte was not detected at or above the RL in the associated samples. Many samples were diluted due to the dark color of the sample extracts. SS-COMP-7 (lab # 450050-008) was diluted due to the color of the sample extract. No other analytical problems were encountered.

Metals (EPA 6010B and EPA 7471A):

High response was observed for antimony in the CCV analyzed 09/09/21 15:28; affected data was qualified with "b". High response was observed for antimony in the CCV analyzed 09/09/21 16:09; affected data was qualified with "b". Low recoveries were observed for antimony in the MS/MSD of SS-COMP-9 (lab # 450050-010); the LCS was within limits, and the associated RPD was within limits. Low recoveries were observed for antimony in the MS/MSD of SS-COMP-25 (lab # 450050-027); the LCS was within limits, and the associated RPD was within limits. High recoveries were observed for silver and barium in the MS of SS-COMP-25 (lab # 450050-027); the LCS was within limits. High RPD was also observed for silver and barium in the MS/MSD of SS-COMP-25 (lab # 450050-027). Low recoveries were observed for antimony in the MS/MSD of SS-COMP-42 (lab # 450050-047); the LCS was within limits, and the associated RPD was within limits. No other analytical problems were encountered.

Dear Rocio:

This letter presents the results of the soil vapor investigation conducted by Optimal Technology (Optimal), for Roux Associates, Inc. on October 11, 2021. The study was performed at 870 N. Sanderson Ave., San Jacinto, California.

Optimal was contracted to perform a soil vapor survey at this site to screen for possible chlorinated solvents and aromatic hydrocarbons. The primary objective of this soil vapor investigation was to determine if soil vapor contamination is present in the subsurface soil.

Gas Sampling Method

At each sampling location, an electric vacuum pump set to draw 0.2 liters per minute (L/min) of soil vapor was attached to the existing well and purged prior to sample collection. Vapor samples were obtained in gas-tight syringes by drawing the sample through a luer-lock connection which connects the sampling probe and the vacuum pump. Samples were immediately injected into the gas chromatograph/purge and trap after collection. New tubing was used at each sampling point to prevent cross contamination.

All analyses were performed on a laboratory grade Agilent model 6890N gas chromatograph equipped with an Agilent model 5973N Mass Spectra Detector and Tekmar LSC 3100 Purge and Trap. A Restek column using helium as the carrier gas was used to perform all analysis. All results were collected on a personal computer utilizing Agilent's MS and chromatographic data collection and handling system.

Quality Assurance

5-Point Calibration

The initial five-point calibration consisted of 20, 50, 100, 200 and 500 ul injections of the calibration standard. A calibration factor on each analyte was generated using a best fit line method using the Agilent data system. If the r^2 factor generated from this line was not greater

than 0.990, an additional five-point calibration would have been performed. Method reporting limits were calculated to be 1-1000 micrograms per cubic meter (ug/m³) for the individual compounds.

A daily calibration check was performed using a pre-mixed standard supplied by Scotty Analyzed Gases. The standard contained common halogenated solvents and aromatic hydrocarbons (see Table 1). The individual compound concentrations in the standards ranged between 0.025 nanograms per microliter (ng/ul) and 0.25 ng/ul.

Sample Replicates

A replicate analysis (duplicate) was run to evaluate the reproducibility of the sampling system and instrument. The difference between samples did not vary more than 20%.

Equipment Blanks

Blanks were run at the beginning of each workday and after calibrations. The blanks were collected using an ambient air sample. These blanks checked the septum, syringe, GC column, GC detector and the ambient air. Contamination was not found in any of the blanks analyzed during this investigation. Blank results are given along with the sample results.

Purge Volume

The standard purge volume of three volumes was purged in accordance with the July 2015 DTSC/RWQCB Advisory for Active Soil Gas Investigations.

Tracer Gas Leak Test

A tracer gas was applied to the soil gas probes at each point of connection in which ambient air could enter the sampling system. These points include the top of the sampling probe where the tubing meets the probe connection and the surface bentonite seals. Isobutane was used as the tracer gas. No Isobutane was found in any of the samples collected.

Shut-in Test

A shut-in test was conducted prior to purging or sampling each location to check for leaks in the above-ground sampling system. The system was evaluated to a minimum measured vacuum of 100 inches of water. The vacuum gauge was calibrated and sensitive enough to indicate a water pressure change of at least 0.5 inches.

Scope of Work

To achieve the objective of this investigation a total of 20 vapor samples were collected from 7 locations at the site. Sampling depths, vacuum readings, purge volume and sampling volumes are given on the analytical results page. All the collected vapor samples were analyzed on-site using Optimal's mobile laboratory.

Subsurface Conditions

Subsurface soil conditions offered sampling flows at 0" water vacuum.

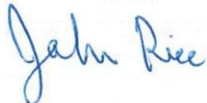

Results

During this vapor investigation, two samples contained levels of Chloroform ranging from 13 ug/m³ to 17 ug/m³. One sample contained 16 ug/m³ of Tetrachloroethene (PCE). One sample contained 5 ug/m³ of Benzene. None of the other compounds listed in Table 1 above were detected above the listed reporting limits. A complete table of analytical results is included with this report.

Disclaimer

All conclusions presented in this letter are based solely on the information collected by the soil vapor survey conducted by Optimal Technology. Soil vapor testing is only a subsurface screening tool and does not represent actual contaminant concentrations in either the soil and/or groundwater. We enjoyed working with you on this project and look forward to future projects. If you have any questions, please contact me at (877) 764-5427.

Sincerely,

John Rice
